

# Leading Up to DevOps

@codewithusama

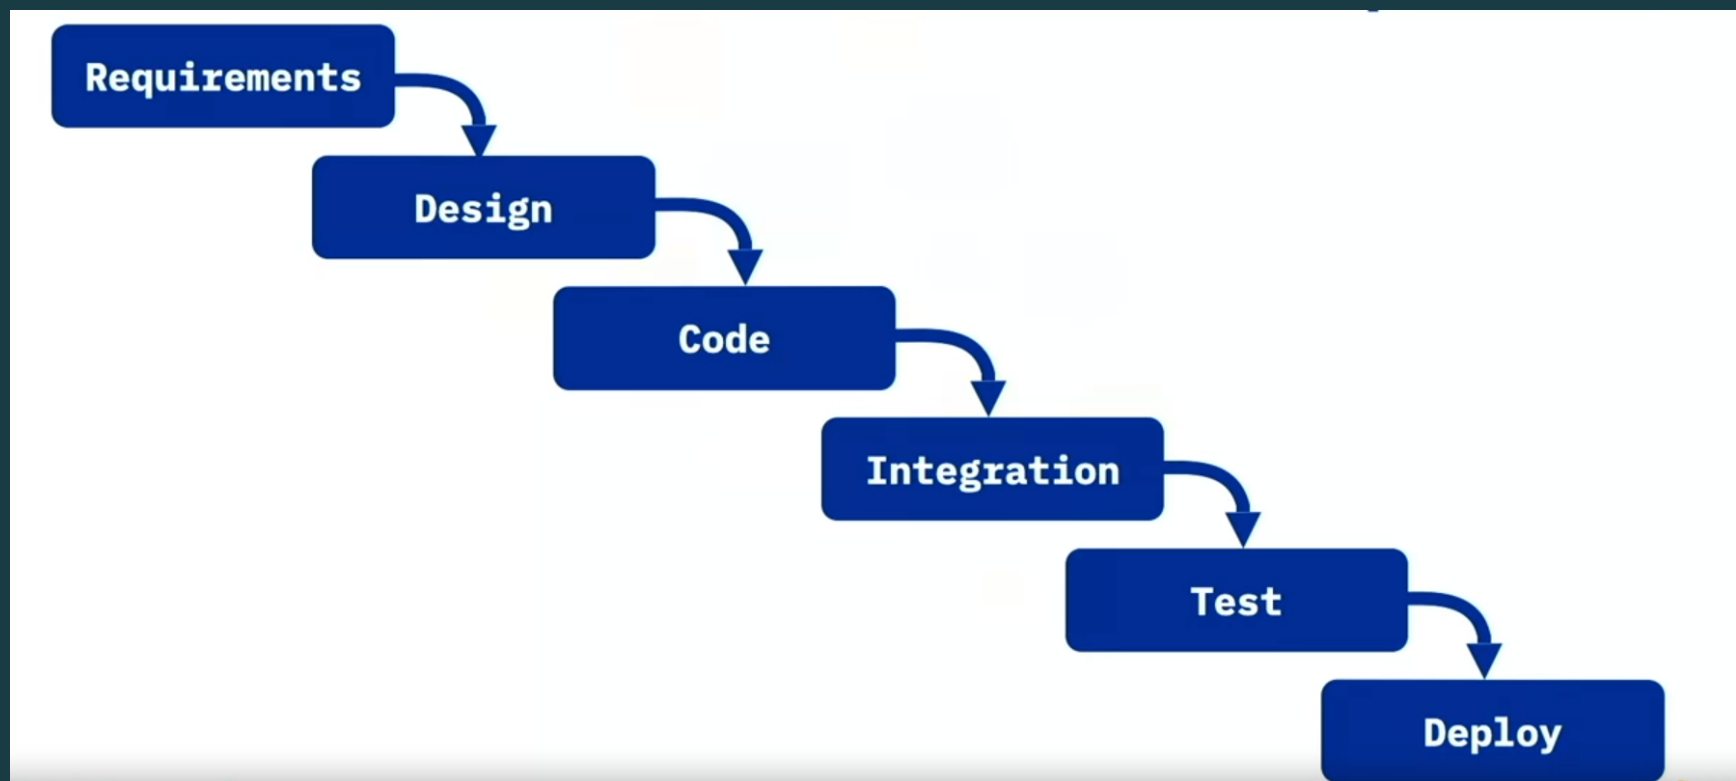

# Leading up to DevOps

- Architecture worked for months designing the system
- Development worked for months on features
- Testing opened defects and sent the code back to development
- At some point, the code is released to operations
- The operations team took forever to deploy

# Traditional Waterfall Development

# Problems with Waterfall approach

- No provisions for changing requirements
- No idea if it works until the end
- Each steps ends when the next begins
- Mistakes found in the later stages are more expensive to fix

# Continue...

- There is usually a long time between software release
- Team work separately, unaware of their impact on each other
- The people who know least about the code are deploying it into production
